## OBLIG 1 — Obligatorisk oppgave 1 av 2

Skriv det komplekse tallet  $z=\frac{6}{\sqrt{3}+3i}$  først på formen a+ib også på polarformen  $re^{i\theta}$ .

$$z = \frac{6}{\sqrt{3} + 3i}$$

$$z = \frac{2}{\sqrt{\frac{1}{3}} + i}$$

$$z = \frac{2 \times (\sqrt{\frac{1}{3}} - i)}{(\sqrt{\frac{1}{3}} + i) \times (\sqrt{\frac{1}{3}} - i)}$$

$$z = \frac{2 \times (\sqrt{\frac{1}{3}} - i)}{\frac{1}{3} - i^{2}}$$

$$z = \frac{2 \times (\sqrt{\frac{1}{3}} - i)}{\frac{4}{3}}$$

$$z = \frac{3 \times (\sqrt{\frac{1}{3}} - i)}{2}$$

$$z = \frac{3 \times (\sqrt{\frac{1}{3}} - i)}{2}$$

With Pythagora's Theorem

$$r = \sqrt{(\frac{\sqrt{3}}{2})^2 + (\frac{3}{2})^2}$$

$$r = \sqrt{\frac{3}{4} + \frac{9}{4}}$$

$$r = \sqrt{3}$$

By the laws of trigonometry

$$\theta' := 2\pi - \theta$$

$$\sin(\theta') = \frac{-1.5}{\sqrt{3}}$$

$$\theta' = \arcsin(\frac{-1.5\sqrt{3}}{3})$$

$$\theta' = \arcsin(\frac{-\sqrt{3}}{2})$$

$$\theta' = -\frac{\pi}{3} \equiv \frac{5\pi}{3}$$

$$\therefore \theta = \frac{\pi}{3}$$

And since z is in the fourth quadrant, as  $Re(z) > 0 \wedge Im(z) < 0$  we know to use  $\theta'$ :

$$r:\sqrt{3}\wedge heta:rac{5\pi}{3}\mathrel{{}_{\stackrel{.}{.}}}z=\sqrt{3}e^{rac{-i\pi}{3}}\equiv\sqrt{3}e^{rac{5i\pi}{3}}$$

11

Finn de to løsningene til likningen  $w^2 - w + 1 = 0$ , og bruk disse til å finne alle komplekse løsninger til likningen  $z^4 - z^2 + 1 = 0$ . Gi en faktorisering av  $z^4 - z^2 + 1$ , først i komplekse førstegradspolynomer og så i reelle andregradspolynomer.

Assuming  $cis(x) \equiv cos(x) + i \cdot sin(x)$ , and  $i^2 = -1$ .

$$a = 1, b = -1, c = 1$$
 (2-1)

$$w = \frac{1 \pm \sqrt{1 - 4}}{2} = \frac{1}{2} \pm \frac{\sqrt{3}}{2}i \tag{2-2}$$

(2-3)

With  $t = z^2$ :

$$z^4 - z^2 + 1 = t^2 - t^2 + 1 = 0 (2-4)$$

$$t = \frac{1}{2} \pm \frac{\sqrt{3}}{2}i\tag{2-5}$$

(2-6)

With  $t_0 = \frac{1}{2} + \frac{\sqrt{3}}{2}i = cis(\frac{\pi}{3})$ :

$$\sqrt{cis(\frac{\pi}{3})}^4 - \sqrt{cis(\frac{\pi}{3})}^2 + 1 = 0 \tag{2-7}$$

$$cis^{2}(\frac{\pi}{3}) - cis(\frac{\pi}{3}) + 1 = 0$$
 (2-8)

(2-9)

With De Moivres formula:

$$cis(\frac{2\pi}{3}) - cis(\frac{\pi}{3}) + 1 = 0 \tag{2-10}$$

$$cos(\frac{2\pi}{3}) + i \cdot sin(\frac{2\pi}{3}) - cos(\frac{\pi}{3}) - i \cdot sin(\frac{\pi}{3}) + 1 = 0$$
 (2-11)

$$-\frac{1}{2} + \frac{\sqrt{3}}{2}i - \frac{1}{2} - \frac{\sqrt{3}}{2}i + 1 = 0$$
 (2-12)

$$-\frac{1}{2} - \frac{1}{2} + 1 = 0$$
 (2-13)  
-1 + 1 = 0 (2-14)

$$(2-15)$$

Therefore,  $z=t_0^{\frac{1}{2}}=cis^{\frac{1}{2}}(\frac{\pi}{3})=cis(\frac{\pi}{6})$  is a root  $z_0$ .

By the complex conjugate root theorem,  $z=t_1^{\frac{1}{2}}=cis^{\frac{1}{2}}(-\frac{\pi}{3})=cis(-\frac{\pi}{6})$  is a root  $z_0'$ .

MAT1100 Obliq 1 2 Autumn, 2019

By dividing by the original polynom by  $(z-z_0)(z-z_0')$ :

$$\frac{z^4 - z^2 + 1}{(z - \frac{\sqrt{3}}{2} - \frac{1}{2}i) \cdot (z - \frac{\sqrt{3}}{2} + \frac{1}{2}i)} = 0$$
 (2-16)

$$\frac{z^4 - z^2 + 1}{(z - \frac{\sqrt{3}}{2})^2 - (\frac{1}{2}i)^2} = 0$$
 (2-17)

$$\frac{z^4 - z^2 + 1}{z^2 - \sqrt{3}z + \frac{3}{4} + \frac{1}{4}} = 0 (2-18)$$

$$\frac{z^4 - z^2 + 1}{z^2 - \sqrt{3}z + 1} = 0 (2-19)$$

By polynomial division: 
$$z^2 + \sqrt{3}z + 1 = 0$$
 (2-20)

Thus the original equation is equivalent to the following:

$$(z^2 + \sqrt{3}z + 1) \cdot (z - cis(\frac{\pi}{6})) \cdot (z - cis(\frac{-\pi}{6})) = 0$$
 (2-21)

Solving for  $(z^2 + \sqrt{3}z + 1) = 0$ , viz.  $(z - z_1)(z - z_1')$ :

$$a = 1, b = \sqrt{3}, c = 1$$
 (2-22)

$$z = \frac{-\sqrt{3} \pm \sqrt{3-4}}{2} \tag{2-23}$$

$$z = \frac{-\sqrt{3}}{2} \pm \frac{i}{2} = cis(\pi \pm \frac{\pi}{6})$$
 (2-24)

$$z_1 = cis(\frac{5\pi}{6}), z'_1 = cis(-\frac{5\pi}{6})$$
 (2-25)

By having  $z_0, z_0', z_1$ , and  $z_1'$ , we can factorize as  $(z - z_0) \cdot (z - z_0') \cdot (z - z_1) \cdot (z - z_1') = 0$ , so  $z^4 - z^2 + 1 = 0$  is equivalent in complex roots to

$$(z - cis(\frac{\pi}{6})) \cdot (z - cis(-\frac{\pi}{6})) \cdot (z - cis(\frac{5\pi}{6})) \cdot (z - cis(-\frac{5\pi}{6})) = 0.$$

By the denominator of 2-19 we know  $(z-z_0)(z-z_0')=z^2+\sqrt{3}z+1$ ,

so  $z^4 - z^2 + 1 = 0$  expressed with second degree polynoms is  $(z^2 - \sqrt{3}z + 1)(z^2 + \sqrt{3}z + 1)$ .

MAT1100 Obliq 1 3 Autumn, 2019

Finn grensene  $\lim_{n\to\infty} \frac{3n+2}{\sqrt{4n^2-1}}$  og  $\lim_{n\to\infty} (\sqrt{n^2-5n}-n)$ .

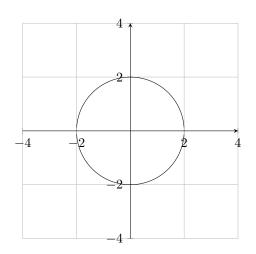

$$\lim_{n \to \infty} \frac{3n+2}{\sqrt{4n^2-1}} = \lim_{n \to \infty} \frac{(\sqrt{n^2-5n}-n)}{\sqrt{4n^2-1}n} = \lim_{n \to \infty} \frac{(\sqrt{n^2-5n}-n)(\sqrt{n^2-5n}+n)}{\sqrt{n^2-5n}+n} = \lim_{n \to \infty} \frac{3+\frac{2}{n}}{\sqrt{4n^2-1}} = \lim_{n \to \infty} \frac{n^2-5n-n^2}{\sqrt{n^2-5n}+n} = \lim_{n \to \infty} \frac{3+\frac{2}{n}}{\sqrt{4-\frac{1}{n^2}}} = \lim_{n \to \infty} \frac{-5n}{\sqrt{1-\frac{5}{n}}+1} = \lim_{n \to \infty} \frac{3+\frac{\beta}{n}}{\sqrt{4-\frac{1}{\beta}}} = \lim_{n \to \infty} \frac{-5}{\sqrt{1-\frac{5}{n}}+1} = \frac{3}{2}$$

Finn de komplekse tallene z som oppfyller likningen 2|z-1|=|z-4| og skisser løsningsmengden i det komplekse planet. (Hint: Sett inn z=x+iy og finn en polynomlikning ix og y forløsningsmengden.)

 $2|z-1| = |z-4| \equiv$  4|x+iy-1| = |x+iy-4|  $4((x-1)^2+(y)^2) = (x-4)^2+(y)^2$   $4(x-1)^2+4y^2=x^2-8x+16+y^2$   $4(x^2-2x+1)+4y^2=x^2-8x+16+y^2$   $4x^2-8x+4+4y^2=x^2-8x+16+y^2$   $3x^2z+3y^2=12$   $y^2=4-x^2$   $y=\pm\sqrt{4-x^2}$ 

 $\therefore Im(z) = \pm \sqrt{4 - Re(z)^2}, \exists z \forall \{x \in Re(z) | -2 < x < 2\}$ 

66

En følge  $\{a_n\}$  er definert ved  $a_1 = 3$ ,  $a_{n+1} = 3\sqrt{a_n}$  for  $n \ge 1$ . Vis at  $a_n < 9$  og at  $a_{n+1} > a_n$  for alle n. Forklar hvorfor følgen konvergerer og finn  $\lim_{n\to\infty} a_n$ 

$$a_1 := 3, \tag{5-1}$$

$$a_{n+1} := 3\sqrt{a_n} \tag{5-2}$$

To be proven by induction:

$$P_n := a_n < 9 \tag{5-3}$$

$$Q_n := a_{n+1} > a_n \tag{5-4}$$

Prove for n=1:

$$a_1 = 3 : a_2 = 3\sqrt{3}$$
 (5-5)

$$P_1 := a_1 < 9 \equiv 3 < 9 : P_1 \tag{5-6}$$

$$Q_1 := a_2 > a_1 \equiv 3\sqrt{3} > 3 : Q_1$$
 (5-7)

Assume  $Q_k$ , and prove  $(Q_k \implies Q_{k+1})$ :

$$Q_k := a_{k+1} > a_k \tag{5-8}$$

$$Q_{k+1} := a_{k+2} > 3\sqrt{a_k} \tag{5-9}$$

$$Q_{k+1} := 3\sqrt{a_{k+1}} > 3\sqrt{a_k} \tag{5-10}$$

$$Q_{k+1} := \sqrt{a_{k+1}} > \sqrt{a_k}$$
 (5-11)

$$Q_{k+1} := a_{k+1} > a_k \tag{5-12}$$

Assume  $P_{k+1}$ , and prove  $(P_k \implies P_{k+1})$ 

$$P_k := a_k < 9 \tag{5-13}$$

$$P_{k+1} := 3\sqrt{a_k} < 9 \tag{5-14}$$

$$P_{k+1} := \sqrt{a_k} < 3 \tag{5-15}$$

$$P_{k+1} := a_k < 9$$
 (5-16)

The sequence converges since all values increment as n increments, but is bounded by 9. We also know by this that the sequence's infinum is 3, as  $a_1 = 3$ 

Since the sequence is convergent, we know its limit exsits:

$$L = \lim_{n \to \infty} a_n \tag{5-17}$$

$$L = \lim_{n \to \infty} 3\sqrt{a_{n-1}} \tag{5-18}$$

Since all  $a_n > 1$ :

$$L = 3\sqrt{\lim_{n \to \infty} a_{n-1}} \tag{5-19}$$

By the monotone convergence theorem:

$$L = 3\sqrt{\lim_{n \to \infty} a_n} \tag{5-20}$$

$$L = 3\sqrt{L} \tag{5-21}$$

$$L^2 = 9L \tag{5-22}$$

$$L = 9 (5-23)$$

 $\Box$ .

Thus we know the supremum of the sequence is **9**.
